New insect on Balearic Islands

17.07.2009

→ nächste Meldung

After 10 years of biochemical and molecular analysis of the *Tyrrhenoleuctra plecoptera* that live in the Western Mediterranean, Spanish and Italian scientists have now demonstrated that one of the insect populations of this group is a distinct and, therefore, new species.

The researchers, including a team from the University of Granada (UGR), used biochemical and molecular techniques for a decade to detail the taxonomical and phylogenetic relationships of the insects of the *Tyrrhenoleuctra plecoptera* genus that are spread across the Western Mediterranean (northern Africa, Iberian Peninsula, Balearic Isles, Corsica and Sardinia). The analyses included three species described using morphological characters as a basis.

"One of the results discovered and published in our studies is that the population of *Tyrrhenoleuctra* on the Balearic Islands is a clearly distinct taxon and demands acknowledgement of its status as an independent species", José Manuel Tierno de Figueroa, co-author of the study and a researcher in the Department of Animal Biology at the UGR explained SINC.

Tyrrhenoleuctra evolve molecularly at a "considerably slower rate than other insects distributed similarly in geographical terms.

Very Different Insects

Populations of insects belonging to the *Tyrrhenoleuctra plecoptera* genus can be found in temporary fresh water streams, sometimes at sea level, "which is very unusual for this group of insects, which generally live in highly oxygenated water in the medium or high alps", Tierno de Figueroa clarified. The scientists performed biochemical and molecular analyses to also discern these insects' biogeographical implications.

A study carried out on a larger scale had already shown great variation in almost all the characters that experts use to separate species. "Thus, intra-specific variability was as high as inter-specific variability, rendering morphological characters useless for identification purposes", the biologist said.

The new species of plecoptera takes the name of *Tyrrhenoleuctra antoninoi* in honour of researcher Antonio Sánchez-Ortega, who died in 2002 after devoting the best part of his life to studying these insects on the Iberian Peninsula.
