

16-47 years assisted at the Health Care Gran Capitán in Granada. 51% were women and 49% were men.

Patient expectations towards their participation in decision making were found to vary depending on the disorder to be treated: thus, when patients suffer chest pain, 32% want to participate in the selection of the treatment and, when there is a serious family health problem the percentage raises to 49%. Women have not got so many expectations when they suffer from depression or when it is a family health problem, and patients that are assisted by a woman physician have greater expectations of participating in problem management when the case is a family health problems or flu.
