Study: Six out of 10 male drug-abusers direct violence against their partners

4. March 2011 00:56

According to a study conducted at the Department of Pedagogy of the University of Granada, about six out of ten male drug-abusers direct some type of violence against their intimate partners. Thus, the study revealed a high rate of domestic violence -both physical and psychological- by male drug-abusers against women. The study also detailed the most recurrent forms of abuse, as well as the variables associated to them.

The study revealed that between 6.5 and 72.4% of the population admits to having committed some form of violence against their partner. The less prevalent conduct was "I forced her to abort against her will" (6.5%), and the most prevailing being "I show total disregard for her needs, wishes and interests". In addition, 63.5% of the respondents ensured that they wanted to know what their partner makes at all times of the day, their hours, whom they speak to-. The rate of physical violence oscillates between 6.5% and 21%, while psychological violence varies between 7.3% and 72.4%.
